(54) Title: NOVEL PROCESS

(57) Abstract: The invention relates to a process for the preparation of a compound of formula (V), according to the following scheme: wherein the various substituents are as defined in the description.

NOVEL PROCESS

5 [0001] This invention relates to novel processes for the preparation of 2-aminomethylpyridines (particularly 2-aminomethyl-3-chloro-5-trifluoromethylpyridine), and for the preparation of 2-cyanopyridines used in their preparation, which compounds are useful as intermediates for the production of pesticides.

10

[0002] The catalytic reduction of cyanopyridines to give aminomethylpyridines is known. However when the cyanopyridine compound contain additional halogen atom(s) the reduction may be complicated by the competing dehalogenation reaction. It is stated by P. N. Rylander, *Hydrogenation Methods* (Best Synthetic
15 Series, published by Academic Press), (1985), page 148, that palladium is usually the catalyst of choice when wishing to effect a dehalogenation reaction, and that platinum and rhodium are relatively ineffective and are hence often used in hydrogenations where the halogen is to be preserved.

20 [0003] In contrast with the above prior art teaching we have found that the use of a palladium catalyst gives particularly good results in the reduction of cyanopyridines which contain additional halogen atom(s). We have developed a new process for the preparation of 2-aminomethylpyridines, which contain additional halogen atom(s) in which minimal dehalogenation occurs, and which is
25 applicable to industrial scale processes.

[0004] There have been a number of procedures published for introducing a cyano group at the 2-position of a pyridine moiety. These typically involve substitution of a halogen, in particular bromine or fluorine, in a polar solvent, e.g. dimethyl
30 sulfoxide or dimethylformamide. In addition, there are numerous methods

starting from the activated pyridine *N*-oxide or *N*-alkylpyridine. Many of these cyanation routes use heavy metal reagents, containing copper or nickel. For example, EP0034917 discloses the preparation of 2-cyano-3-chloro-5-trifluoromethylpyridine from the 2-bromo analogue by reaction with cuprous
5 cyanide in dimethylformamide at 120°C.

[0005] However, many of these prior art processes suffer from one or more drawbacks, including poor yields, use of heavy metals which produce toxic effluents, or polar solvents which are difficult to recover. Further, methods which
10 involve formation of the pyridine *N*-oxide or *N*-alkylpyridine involve several steps. These drawbacks are more critical on scale-up to industrial scale.

[0006] GB Patent Publication Number 117970 describes the cyanation of 2-halopyridine compounds with an activating agent and a cyanide source in a
15 polar solvent and thus avoids many of the above disadvantages. However there still remains with this procedure the need to recycle the activating agent and the aprotic solvent in order to minimise the costs for an industrial scale process.

[0007] We have now developed an alternative and improved process for the
20 preparation of 2-cyanopyridines which is applicable to industrial scale processes.

[0008] According to a first aspect of the present invention, there is provided a process (A) for the preparation of a compound of general formula (I):

25 or a salt thereof, which process comprises the catalytic hydrogenation of a compound of general formula (II):

or a salt thereof,

wherein X is halogen; each Y, which may be the same or different, is halogen,

5 haloalkyl, alkoxycarbonyl or alkylsulphonyl; and n is 0 to 3.

[0009] In this invention halogen means a fluorine, chlorine or bromine atom. The preferred halogen atom is chlorine.

10 [0010] Haloalkyl typically means a C₁ to C₆ alkyl moiety substituted by one or more halogen atoms. For example the C₁ to C₆ alkyl moiety may be methyl, ethyl, n-propyl or i-propyl, preferably methyl. The C₁ to C₆ alkyl moiety is preferably substituted by one or more chlorine or fluorine atoms. A more preferred haloalkyl group is trifluoromethyl.

15

[0011] An alkoxycarbonyl group is typically C₁ to C₆ alkoxycarbonyl such as methoxycarbonyl, ethoxycarbonyl, n-propoxycarbonyl or i-propoxycarbonyl.

[0012] An alkylsulphonyl group is typically C₁ to C₆ alkylsulphonyl in which the
20 C₁ to C₆ moiety is as defined above.

[0013] Preferably X is chlorine.

[0014] Preferably Y is halogen or haloalkyl (more preferably trifluoromethyl).

25

[0015] Compound (II) is preferably 3-chloro-2-cyano-5-trifluoromethylpyridine.

[0016] The catalyst generally comprises a metal selected from palladium, platinum, ruthenium, nickel and cobalt. The amount of metal in the catalyst used (which is generally supported on for example charcoal) is generally from 0.05-0.7% by weight relative to the amount of the compound of formula (II), preferably
5 from 0.05-0.3%, more preferably from 0.1-0.2%. A preferred catalyst contains palladium, for example finely divided palladium on an inert carrier such as charcoal. This has been found to give both a convenient reaction rate and minimal side reactions. Thus when the compound of formula (II) is 3-chloro-2-cyano-5-trifluoromethylpyridine, minimal dechlorination occurs when using the process of
10 the invention. Other examples of suitable catalysts include catalysts comprising oxides or other compounds of the above mentioned metals.

[0017] The process is typically carried out in the presence of a solvent such as an alcohol, for example methanol, ethanol, propanol or butanol, or an ester such as
15 ethyl acetate, or an ether such as tetrahydrofuran. Alcohol solvents are preferred (methanol is most preferred). The process is preferably performed in the presence of a strong acid such as hydrochloric acid, hydrobromic acid, sulphuric acid or phosphoric acid (preferably hydrochloric acid). The presence of the acid helps prevent poisoning of the catalyst by the amino group of the product of formula (I),
20 and also prevents the coupling of amino intermediates which is otherwise known to occur during the catalytic hydrogenation of nitriles.

[0018] The reaction conditions typically comprise combining all reactants in a suitable reaction vessel and stirring, for example at a temperature of from 0 to
25 60°C, preferably from 20 to 30°C. A further advantage of the process is that low pressures are used, with a hydrogen pressure of from 1 to 4 atmospheres generally being employed (the process is preferably performed at 1 atmosphere).

[0019] The reaction is optionally performed in the presence of a catalyst inhibitor,
30 which can lead to a further improvement in the reaction selectivity by reducing the

amount of dehalogenation which may occur as a side reaction. Such catalyst inhibitors are known in the art, for example as described in P.N.Rylander in Hydrogenation Methods (Best Synthetic Series, published by Academic Press), 1985, pages 125-126, and include alkali metal bromides or iodides such as
5 potassium bromide and potassium iodide; or ammonium bromide or ammonium iodide; or hydrogen bromide or hydrogen iodide; or phosphorus compounds such as triphenyl phosphite, hypophosphorous acid, phosphorous acid or alkylphosphinic acids; or thiodiglycol (2,2'-thiodiethanol); or thiourea; or sulphur. Preferably the catalyst inhibitor is selected from an alkali metal bromide or iodide,
10 ammonium bromide or iodide and hydrogen iodide.

[0020] The present invention thus provides a high yielding, selective and convenient process for the preparation of 2-aminomethylpyridines .

15 [0021] It is particularly convenient to generate the compound of formula (I) in the form of a salt, especially a hydrochloride salt. When used as an intermediate in the production of a pesticide the salt can be submitted directly to the next reaction step without prior isolation of the corresponding free amine. The production of the salt and its subsequent reaction can therefore be conveniently carried out in a
20 single vessel. A particularly preferred salt is 2-aminomethyl-3-chloro-5-trifluoromethylpyridine hydrochloride.

[0022] According to a further feature of the present invention, there is provided a process (B) for the preparation of a compound of general formula (II) as defined
25 above which comprises treating a compound of general formula (III):

with a cyanide source and a catalyst in an aqueous solvent or without solvent,

wherein X, Y and n are as hereinbefore defined; and wherein the cyanide source is hydrogen cyanide, an alkali metal cyanide, an alkaline earth metal cyanide or an optionally substituted ammonium cyanide.

[0023] The catalyst is generally a phase transfer catalyst such as a tetraalkyl ammonium salt such as benzyl trimethylammonium chloride, tricaprylmethylammonium chloride, tetramethylammonium chloride, tetra-n-propylammonium bromide, n-dodecyl trimethylammonium chloride, tetra-n-butylammonium chloride, tetra-n-butylammonium bromide, tetra-n-octylammonium bromide or n-tetradecyl trimethylammonium bromide; or a tetraalkyl phosphonium salt such as tetra-n-butylphosphonium bromide or tetraphenylphosphonium bromide; or a crown ether or acyclic analogue thereof such as TDA-1 (tris[2-(2-methoxyethoxy)ethyl]amine); or an amine such as 4-dimethylaminopyridine.

[0024] Preferably the catalyst is selected from tricaprylmethylammonium chloride and tetra-n-octylammonium bromide.

[0025] The amount of catalyst used is generally from about 0.01 to 10 mol %, preferably from about 0.1 to 5 mol %, more preferably from about 1 to 5 mol %.

[0026] Compound (III) is preferably 3-chloro-2-fluoro-5-trifluoromethylpyridine.

[0027] The above process (B) of the invention is a high yielding process for the preparation of 2-cyanopyridines, which is simple to perform and operates at moderate temperatures and does not suffer from the drawbacks of many prior art processes. In particular the process of the invention does not require heavy metal cyanides such as copper or nickel cyanide, which, when used on an industrial

scale, produce toxic effluent streams and are difficult to recover. The process (B) of the invention produces waste streams, which are readily treatable.

[0028] In addition, the process does not require the preparation of activated
5 pyridine *N*-oxide or *N*-alkylpyridine for high conversions, which is a requisite for many of the prior art processes. The process (B) of the invention does not require an activating agent such as 4-dimethylaminopyridine and hence avoids additional recovery and recycling steps. A further advantage of the process (B) of the invention is that organic solvents are not used in the reaction, thus avoiding the
10 need to recycle expensive solvents such as dimethyl sulphoxide.

[0029] The cyanide source is preferably sodium cyanide or potassium cyanide, preferably potassium cyanide. The amount of cyanide source used is generally from about 1.0 to about 2.0 molar equivalents (however more may be used if
15 desired), preferably from 1.0 to 1.5 molar equivalents, more preferably from 1.0 to 1.1 molar equivalents.

[0030] The reaction is generally and preferably performed using water as solvent, however it may also be carried out in the absence of solvent.
20

[0031] The reaction conditions typically comprise combining all reactants in a suitable reaction vessel and stirring at a temperature of from 10 to 60°C, preferably from 20 to 40°C.

[0032] The present invention thus provides a high yielding process (B) for the preparation of 2-cyanopyridines. Since the reaction uses moderate reaction temperatures, simple and inexpensive reactors and downstream processing equipment is all that is required. Furthermore, since the reactants are readily available, the process is inexpensive to operate. In addition, the present process
30 produces waste streams that are readily treatable.

[0033] According to a further feature of the invention the processes (B) and (A) can be combined to prepare a compound of formula (I) from a compound of formula (III).

5

[0034] According to a further feature of the invention the process (A), or the combined processes (B) and (A), is followed by a further process step (C) which comprises the acylation of said compound (I) with a benzoyl compound of formula (IV):

10

wherein L is a leaving group; R¹ and R² each represent the same or different halogen; and m is 0, 1 or 2, to give a compound of formula (V):

15

[0035] Preferably L is chlorine.

[0036] Compounds of Formula (V) are valuable pesticide active ingredients disclosed for example in International Patent Publication Number WO 99/42447.

20

[0037] Preferred compounds of formula (V) are:

- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,6-dichlorobenzamide;
- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,6-difluorobenzamide;

- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2-chloro-6-fluorobenzamide;
- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,3-difluorobenzamide;
- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,4,6-trifluorobenzamide or
- * N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2-bromo-6-chlorobenzamide.

5

[0038] Process step (C) is described in International Patent Publication Number WO 99/42447.

10 [0039] According to a further feature of the invention the process (B), or the combined processes (B) and (A), or (B), (A) and (C) can be combined with an earlier process step (D) which comprises the fluorination of a compound of formula (VI):

wherein X, Y and n are as defined above.

15

[0040] The process step (D) is generally performed using a suitable fluorinating agent such as an alkali metal fluoride, preferably potassium fluoride or sodium fluoride, in an aprotic solvent such as dimethyl sulphoxide or sulfolane, at a temperature of from 50°C to 150°C.

20

[0041] The compounds of formula (I) and (II) obtained by the above processes of the invention are particularly useful in the preparation of fungicidally active 2-pyridylmethylamine derivatives of formula (V), according to the following reaction scheme:

[0042] The present invention is further illustrated by the following preparative examples:

5 **Example 1 (Process step A)**

A mixture of 3-chloro-2-cyano-5-trifluoromethylpyridine (5.1g) and 5% palladium on charcoal (5.1 mg as Pd metal) was stirred at 20°C with methanol and concentrated hydrochloric acid (2.5ml) under 1 atmosphere of hydrogen. After 4 hours the reaction was judged to be complete by hplc. The mixture was filtered
 10 through Celatom, washed with methanol and water and evaporated to give 2-aminomethyl-3-chloro-5-trifluoromethylpyridine hydrochloride in 95-97% yield, NMR (in D₂O) 4.6 (s, 2H), 8.35 (s, 1H), 8.9 (s, 1H).

Example 2 (Process Step B)

15 A solution of potassium cyanide (7. Aliquat 336 (tricaprylmethylammonium) maintained at this temperature for 4 hours. The fluoride was less than 1% by hplc. The mixture was washed with aqueous sodium chloride solution.
 20

 Dann (W002/16322)*

cyano-5-trifluoromethylpyridine (185.8g, 90% yield) bp 90°C at 15mbar. The purity of this product was 98%.

Example 3 (Process Step B)

- 5 Solid sodium cyanide (0.29g) was added to a stirred mixture of 3-chloro-2-fluoro-5-trifluoromethylpyridine (0.8g) and tetrabutylammonium bromide (0.06g) at 20-25°C, and stirred for 23 hours to give 3-chloro-2-cyano-5-trifluoromethylpyridine (0.68g, 82% yield by hplc).

10 **Example of Process Step (D)**

- 2,3-Dichloro-5-trifluoromethylpyridine (800g) was added to a stirred mixture of anhydrous potassium fluoride (320g) and anhydrous dimethylsulphoxide at 110°C then heated at 120°C for 2 hours and fractionally distilled under reduced pressure to give 3-chloro-2-fluoro-5-trifluoromethylpyridine (685g) in a yield of 92% (98%
15 purity).

CLAIMS

1. A process for the preparation of a compound of general formula (I):

- 5 or a salt thereof, which process comprises the catalytic hydrogenation of a compound of general formula (II):

or a salt thereof,

- wherein X is halogen; each Y, which may be the same or different, is halogen,
10 haloalkyl, alkoxy carbonyl or alkylsulphonyl; and n is 0 to 3.

2. A process according to claim 1 in which X is chlorine.

3. A process according to claim 1 or 2 in which Y is halogen or haloalkyl.
15

4. A process according to claim 3 in which Y is trifluoromethyl.

5. A process according to claims 1 to 4 in which the catalyst comprises a metal selected from palladium, platinum, ruthenium, nickel and cobalt.
20

6. A process according to claims 1 to 5 in which the catalyst is palladium.

7. A process according to claim 5 or 6 in which the amount of metal in the catalyst is from 0.05-0.7% by weight relative to the amount of the compound of formula (II).
- 5 8. A process according to claim 5 or 6 or 7 in which the amount of metal in the catalyst is from 0.05-0.3% by weight relative to the amount of the compound of formula (II).
9. A process according to claim 5 or 6 or 7 or 8 in which the amount of metal
10 in the catalyst is from 0.1-0.2% by weight relative to the amount of the compound of formula (II).
10. A process according to any one of the preceding claims which is conducted in the presence of an alcohol solvent.
- 15 11. A process according to claim 10 in the alcohol solvent is methanol.
12. A process according to any one of the preceding claims which is performed at 0 to 60°C.
- 20 13. A process according to any one of the preceding claims which is performed at a hydrogen pressure of from 1 to 4 atmospheres.
14. A process according to any one of the preceding claims which is
25 performed in the presence of a catalyst inhibitor.
15. A process according to claim 14 in which the catalyst inhibitor is selected from an alkali metal bromide or iodide, ammonium bromide or iodide and hydrogen bromide or iodide.

16. A process according to any one of the preceding claims in which the compound of formula (II) is 3-chloro-2-cyano-5-trifluoromethylpyridine.

17. A process for the preparation of a compound of general formula (II) as
5 defined in any one of claims 1 to 4, which process comprises treating a compound of general formula (III):

with a cyanide source and a catalyst in an aqueous solvent or without solvent,
10 wherein:

X, Y and n are as defined in claim 1; and wherein the cyanide source is hydrogen cyanide, an alkali metal cyanide, an alkaline earth metal cyanide or an optionally substituted ammonium cyanide.

18. A process according to claim 17 in which the catalyst is a phase transfer catalyst; or a crown ether or acyclic analogue thereof; or an amine.

19. A process according to claim 17 or 18 in which the catalyst is a tetraalkyl ammonium salt or a tetraalkyl phosphonium salt.

20

20. A process according to claim 17, 18 or 19 in which the catalyst is selected from tricaprylmethylammonium chloride and tetra-n-octylammonium bromide.

21. A process according to any one of claims 17 to 20 in which the amount of
25 catalyst used is from 0.01 to 10 mol %.

22. A process according to any one of claims 17 to 21 in which the cyanide source is potassium cyanide.
23. A process according to any one of claims 17 to 22 in which the amount of cyanide source used is from 1.0 to 2.0 molar equivalents.
24. A process according to any one of claims 17 to 23 in which the solvent is water.
25. A process according to any one of claims 17 to 24 in which the temperature is from 10 to 60°C
26. A process according to any one of claims 17 to 25 in which the compound of formula (III) is 3-chloro-2-fluoro-5-trifluoromethylpyridine.
27. A process according to any one of claims 17 to 26, which is followed by a process according to any one of claims 1 to 16.
28. A process according to any one of claims 1 to 16 or 27, which is followed by a further process step which comprises the acylation of said compound (I) with a benzoyl compound of formula (IV):

wherein L is a leaving group; R¹ and R² each represent the same or different halogen; and m is 0, 1 or 2, to give a compound of formula (V):

29. A process according to claim 17, 27 or 28 which is combined with an earlier process step which comprises the fluorination of a compound of formula

5 (VI):

wherein X, Y and n are as defined above.

30. A process according to any one of the preceding claims in which X is
10 chlorine.

31. A compound of formula (I) when produced by a process as defined in any one of claims 1, 27 or 30.

15 32. A compound which is 2-aminomethyl-3-chloro-5-trifluoromethyl-pyridine hydrochloride.

33. A compound of formula (II) when produced by a process as defined in claim 17 or 29.

20

34. A compound of formula (V) when produced by a process as defined in claim 28 or 29.

35. A compound according to claim 34 which is:

N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,6-dichlorobenzamide;

N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,6-difluorobenzamide;

N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2-chloro-6-fluorobenzamide;

5 N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,3-difluorobenzamide;

N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2,4,6-trifluorobenzamide or

N-[(3-chloro-5-trifluoromethyl-2-pyridyl)methyl]-2-bromo-6-chlorobenzamide.

36. A process for the preparation of compounds of formula (V), characterised

10 by the following scheme:
